CDNA was prepared from a glandular pool of tissues from thyoid, parathyroid, adrenal, cortex and pineal gland. 5' and 3' adaptors were used in cloning as follows: 5' adaptor sequence: 5'-CACGGCATTATGGC-3' and 3' adaptor sequence: 5'-ATTCTAGAGCCGCAGATGGC-3' and 3' adaptor sequence: 5'-ATTCTAGAGCCGAGAGCGACATG-GT(30) BN-3' (where B = A, C, or G and N = A, C, G, or T). Average insert size 1.38 by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a DNA sequence encoding the light chain variable region of primate monoclonal antibody anti-human CD23 5E8. The invention provides primate monoclonal antibodies which specifically bind human CD23, the low affinity receptor for IgE (FCeRii/CD23), and comprise either of a human gamma-1 or human gamma-3 constant region that binds to human FC gamma receptors and inhibits IgE expression. The monoclonal antibodies of the invention are claimed to be useful for inhibiting induced IgE production for treating or preventing allergic. Inflammatory and autoimmune conditions e.g. allergic rhinitis conjunctivitis, autoimmune hasmolytic anaemia, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300

This is the nucleotide sequence of novel target plasmid Mandy.

The plasmid includes an inactivated murine dihydrofolate reductase

(DHFR) gene, the Escherichia coll beta-galactosidase gene,

baculovirus DNA, a cassette comprising the promoter and enhancer

elements from cytomegalovirus and SV40 virus, the E. coli

beta-glucuronidase (GUS) gene, firefly luciferase gene, an

inactivated Salmonella typhimurium histidinol dehydrogenase (HisD)

gene and transposon TnS neomycin phosphotransferase (neo) gene

contention provides a novel method for integrating a desired

invention provides a novel method for integrating a desired

invention provides a novel method for integrating a desired

coll via homologous recombination. This involves transfecting the

cell via homologous recombination as Desmond (see Aav61792), which

cell with a 'marker plasmid' such as Desmond (see Aav61792), which

contains a unique sequence that is foreign to the mammalian cell

genome and which provides a substrate for homologous recombination,

followed by transfection with a 'target plasmid', such as Mandy

con Molly (see AAV61793), containing a sequence which provides for

homologous recombination with the unique sequences contained in

the marker plasmid, and further comprising a desired DNA that is

to be integrated into the mammalian cells, typically an

immunoglobulin or other secreted mammalian glycoprotein. The

contains electable marker. The neo gene as a

contained and the marker. The neo gene is split into 3 exons. mammalian cells, and can be used to express any type of recombinant protein. The use of a triply spliced selectable marker means that all selected colonies arise from homologous recombination. In of the targeting vector with the integrated marking vector results in correct splicing of all 3 exons of the neo gene and expression of a functional neo protein. The method is applicable to all Commission between Matrix and the marker plasmid and becomes integrated into the host cell genome upon integration of the marker plasmid into the mammalian cells. Exons I and 2 are present on the targeting plasmid, and are separated by an intron into which at least one gene of interest is cloned. Homologous recombination e.g. addition, the number of colonies that need to be screened to identify high producer clones is reduced. An amplifiable gene be inserted on integration of the marking vector, so that when gene is targeted to this site, the gene is further enhanced by expressing, comprises homologous recombination using specific integration of DNA in mammals for selectable marker and target plasmids Example 1; Fig 10; 114pp; English - sulingo amplification [mmnnog] Site

The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antistreriosclerotic, cardiant and hepatropic activity. (I) induce antistreriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

```
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a human immunoglobulin light chain kappa variable region subgroup type I which is used in the construction of humanised anti-Fas antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention.
                                                                     anti-Fas antibody, used for preventing and
                                                                                                                                          Example 15 (Preparatory); Page 40; 194pp; Japanese.
                                                                                            treating autoimmune diseases, allergy, and atopy
                                                                     containing humanised

Claim 1; SEQ ID No 121; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to cDNAs encoding them (ABO\$4131-ABQ\$6305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens and the use of ovarian antigens, and the use of ovarian antigen polynucleotides adainst human ovarian antigens, and the use of ovarian antigen polynucleotides adainst human ovarian antigens, and the use of ovarian polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, clasorders (e.g., infertility, disorders of pregnancy, anovulation, clasorders, infertility, disorders of pregnancy, anovulation, cshock syndrome, ovarian cysts, and dysmenorrhoea), and toxic cshock syndrome, inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired confined system disorders (e.g., anaemia), cardiovascular disorders (c.g., anaemia), chimiary system disorders. Ovarian antigen polypoptides and confined and confirmation of individuals and in forensic analysis, and the confirmation of individuals and in forensic analysis, and the confirmation of individuals and in forensic analysis, and the present antibodies represented the analysis and an antibodies and an antibodies and an antibodies and an antibodier and an useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigen of the nvention.

printed Note: The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

The isotype of a MAD secreted by the human/human hybridoma HT was determined to be and kappa. Human MAb was purifited, and the antigen recognised human MAb CLN"-IgM identified by western blotting.

The present invention relates to novel human monoclonal antibodies. The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of human TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such as tissue fibrosis in the lung, liver, skin, kidney or other tissues.
                                                                                                                                                                             240

The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, and for inducing antibody-dependent cytotoxicity against AILIM-expressing cells and/or immune cytolysis or apoptosis of AILIM-expressing cells (I) is useful for treating or apoptosis of prophylaxis of delayed type allergy. (I) is useful for treating and preventing various diseases associated with AILIM-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preventing various thereases associated with Annia decorporation and/or transduction, and for inhibiting the onset and/or advancement of the diseases. (1) is useful for suppression, prevention and/or treatment of rheumatoid arthritis, multiple sclerosis, autoimmune thyroiditis, allergic context-type dermatitis, chronic inflammatory dermatosis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, psoriasis, autoimmune or allergic disorders, inflammation, graft versus host reaction, graft versus host disease, immune rejection, disorders caused by abnormal intestinal inflammation, profit of the profi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antigenspecific donor antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human manigenspecific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate proteins), but retain the full antigen-binding affinity of the donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibodies containing donor complementarity determining regions and non-human primate acceptor frameworks, having reduced immunogenicity in

Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antigenspecific donor antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human antigenspecific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate proteins), but retain the full antigen-binding affinity of the donor
                                                                                                                                                                                                                                                                                                                  Antibodies containing donor complementarity determining regions and non-human primate acceptor frameworks, having reduced immunogenicity in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGATGTGACATCCAGATGACCCAGTCTCCATCTTCCCTGTCTGCATCTGTAGGGGACAGA

                                                                                                                                                                                                                                              fragment, has at least one of the following properties: acting on dendritic cells to produce IL-12 in the presence of LPS (lipopolygaccharide) and IFNgamma (interferon gamma); acting on dendritic cells to activate maturity of the dendritic cells with high G28-5 antibody; and activating CD95 expression with high G28-5 antibody against a cell line. Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies for autoimmune diseases, allergy or coagulation factor VIII inhibitors syndrome. This polymucleotide sequence represents a coding DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GTCACCATCACTTGTCGGGGGAGTCAGGGTATTAGCAGCTGGTTAGCCTGGTATCAGCAG 238

```
A novel composition has been developed which comprises an immunoglobulin (Ig) having an affinity constant (Ka) of at least 2 multiply 1000000000 M-1 for binding to a predetermined human antigen. The present sequence represents a human light chain variable region partial nuclectide sequence, 10CS kappa, which encodes an amino acid sequence from a claimed immunoglobulin that specifically binds human CD4. The anti-CD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These autoimmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of funditible isotypes by undergoing isotype switching. These animals produce a first Ig type that is necessary for antigen-stimulated B-cell maturation and can switch to encode and produce one or more subsequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

AAV39232-41 represent functional transcripts of a human IgGKappa anti-CD4 antibody. The sequences are isolated from 5 different transgenic mouses hybridoma cell lines. The specification describes transgenic monse hybridoma cell lines. The specification describes transgenic mon-human animals, especially a mouse, which are capable of producing a human heterologous antibodies of multiple isotypes by undergoing isotype switching. The transgence animals have human heavy and light chain transgenes. The transgenes are capable of functionally rearranging a heterologous diversity (D) gene in a heavy Chain transgene comprising at least one V, D and J gene segment, and one constant region gene segment. The immunoglobulin (Ig) light chain constant region gene segment in the gene segment and one constant region gene segment are heterologous to the transgenic animal. The antibody can be used to prevent efflux of neutrophils from cantibodies are used to reduce undesirable autoimmune reactions, inflammatory responses and rejection of transplanted organs. The antibodies can reduce tissue damage and prolong survival in animal models of acute adult respiratory distress syndrome (ARDS) and cid induced lung injury. The antibodies can also be used for the treatment of vasculitis, septic shock, allergic reactions (e.g.

Patent No. US200200620091

GENERAL INFORMATION:

APPLICANT: Taylor, Alexander H

TITLE OF INVENTION: Monoclonal Antibodies with Reduced

TITLE OF INVENTION: Immunogenicity

FILE REPERENCE: P50770

CURRENT APPLICATION NUMBER: US/09/905,243

CURRENT PILING DATE: 2001-07-16

PRIOR FILING DATE: 1999-04-28

NUMBER OF SEQ ID NOS: 97

SOFTWARE: Fast SEQ for Windows Version 3.0

FENCINE TO NOS: 97

SOFTWARE: Fast SEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 324.6; DB 9;
